

WGCNA modules carrying an age or training association

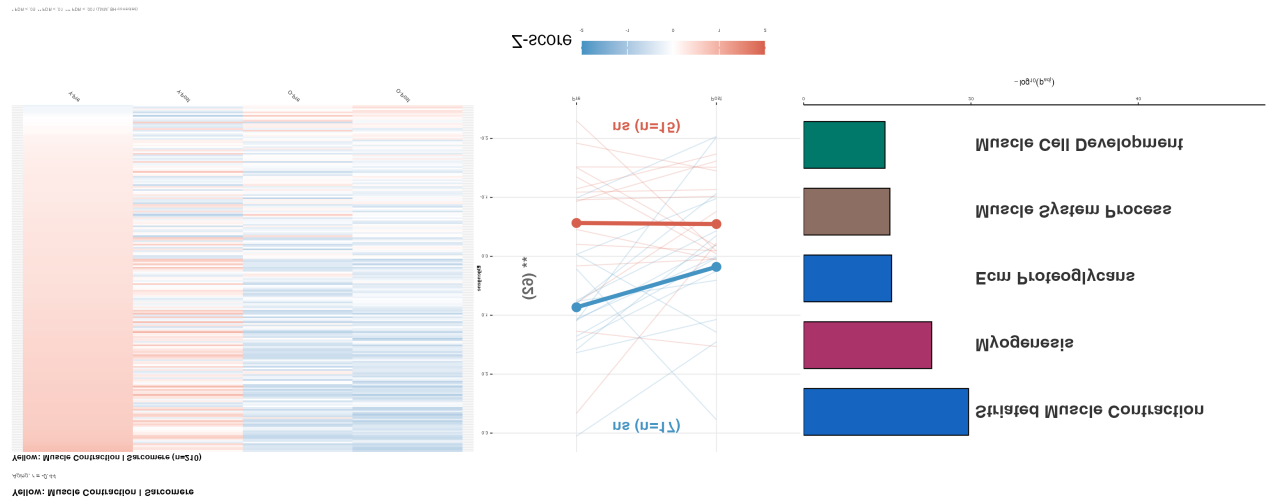

A Turquoise: Lipid Catabolism | TCA Cycle (age $r = +0.58$, $q = 2.5e-05$)

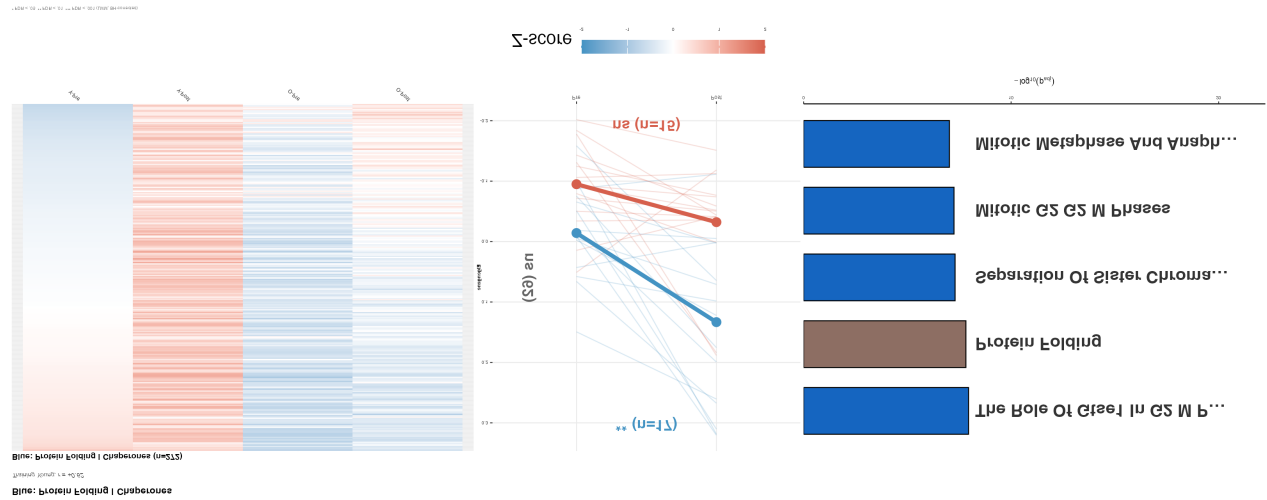

B Black: Glycolysis | Transl. Fact. (age $r = -0.60$, $q = 2.3e-05$)

C Yellow: Muscle Contraction | Sarcomere (age $r = -0.44$, $q = 8.1e-03$)

D Blue: Protein Folding | Chaperones (training in the young $r = +0.62$, $q = 2.2e-03$)

S8 Figure. Protein-level detail for the four WGCNA modules carrying an association. One row per module: every assigned protein as a group-mean z-score across the four age x timepoint cells (left); the module eigengene for each subject from pre to post in both age groups (center); and the module's most enriched over-representation terms (right). (A) Turquoise, Lipid Catabolism | TCA Cycle. (B) Black, Glycolysis | Transl. Fact. (C) Yellow, Muscle Contraction | Sarcomere (D) Blue, Protein Folding | Chaperones.
