

Row 1 (Age): Combined ME = (Pre+Post)/2 per subject, null. Row 2 (Δ VL responder): median-opt of age-residualized VL predictor vs the ME. Rows 4-5 (age-specific Pre vs Post): paired within subject; Young null vs Δ VL null vs Δ O null. Row 3 (LBM): median-opt of age-residualized baseline LBM predictor vs the ME. Row 6 (Pre vs Post): raw ME values stacked across 30 subjects.

Y line size = Pearson's r per stratum (Y/O). Figure B/C shows the raw cells with the boxed raw $p < 0.05$ BH.
